Must Mother Work?

By Robert C. Hendrickson

STUDY IN THE LIFE OF TWO WORKING MOTHERS. In millions of families both husband and wife are the breadwinners. Such a situation is not unusual, but often it is unavoidable. A broken home or illness can force a mother to work to support her family. But these situations account for only a small fraction of the working mothers. What about the rest?

In many instances the mother is only working to extract the wages of her children's welfare. She is placing the welfare of her children to keep up with the Joneses. No doubt she is sincere in her beliefs that what she is doing is best for her family. Hendrickson often, it is too late that she realizes her mistake.

ALL THE CASE OF A FAMILY with four children in Korea. After their oldest had married and moved away, the mother decided to go to work to supplement the family income. The youngest child, a girl of fifteen, would take care of the dishes and keep the house clean.

For a time all went well. But an empty house has a tomb-like quality. Soon the girl began to dread opening the door and stepping into the lifeless vacuum. Instead she spent her

time with other children lonely and without guidance like herself. Before long she found herself in the Iowa Training School for Girls.

WHAT NOW? KNOW how empty a house can be when mother is not there to talk to you, the girl explained to the Training School Superintendent. Her simple words sum up better than anything I can say the needs of growing family has for the love and counsel of a mother. With no one at home to direct them, children are left to their own devices. When problems arise, as they certainly will, they must solve them in their own way.

But it is not enough for parents to be with their children. Equally important are the kind of precepts and example they offer them. A good home is a school of religious training where spiritual and moral values are impressed on the young along with their Pabum.

ON THEIR WEDDING day, all parents were entrusted with the serious duty of rearing the children. God would bless them with. If they neglect giving their children the love and care they alone can give them, then they are depriving these children of their greatest need. What's more, they are preparing fertile ground for juvenile delinquency.

CONGRESSIONAL SIDELIGHTS

by CONGRESSMAN WILSON COLEMAN

THE FOREIGN POLICY

The House last week by a vote of 355 to 61 approved the President's Middle East Doctrine about which there has been so much discussion.

The resolution has two provisions: 1. It would serve notice on the masters of the Kremlin that if they started any aggression in those anti-Communist countries, the United States would resist it with armed power if necessary; 2. It provides for economic assistance to those countries.

There was as might be expected a division of opinion among the Congressmen as to the merit of the proposal. It is an issue on which honest minds could well differ.

Personally, we favored the warning of force if necessary, but we were opposed to the economic aid provision. In the Committee on Rules we earnestly endeavored to secure an amendment in order that the two provisions could be separated in the House, given an opportunity to express itself by appropriate amendments. However, the leadership on both the Democratic and Republican sides insisted on a closed rule which would permit no amendments and a majority of the Members of the Rules Committee responded to their wishes. Along with 148 other Members we voted against the rule. However, the resolution provides that the 200 million dollars requested for economic aid would be taken from monies already appropriated under the Foreign Aid Program.

On the question of the use of force if necessary to prevent further aggression in those little free states we ended in no agreement, but in fact over 2000 World War veterans supported a firm policy to defend our allies. In our judgment, too long have we followed the Chamberlain-like appeasement policy in dealing with the Kremlin masters. Too long have we, the richest and most powerful Nation in the world, suffered the present type of aggression in an effort to oppose the Communist leaders.

Our aims have been circumscribed in their actions and now the high cost. Our relatives have been forced and coerced by the Board of Water Commissioners.

As far as we are concerned, we have accepted an approach that does not do the same for the past decade and a half. On the other hand, the Board of Water Commissioners have not done the same for the past decade and a half. We have taken over the law of trying to destroy our rights, and that one over the other. As soon as they have taken over the law of the water, they have taken over the law of the streets. As soon as the city commissioners have taken over the law of the streets, they will have right to interfere with the law of the water. As soon as they have taken over the law of the water, they will have right to interfere with the law of the streets.

There is no way to avoid the fact that the law of the streets is the law of the water, for many of the streets, unless the Board can have certain specific rights, will be subject to flooding or washing of sand and gravel.

Nothing in the law shall

interfere with the right to the use of water from a spring, stream, or lake.

NOTES

By HOWARD P. SHERMAN

Mississippi State

Spring Wind Control

As May has been designated "Wind Control Month," now is the time to get your weed control program underway.

Dock and wild onions present

in Mississippi problems. Dock and wild onions attack onion and cotton which will not kill oats or small grain or most common pasture grass.

Wild onions can be killed with minor herbicide which kills all growing plants and should only be used on areas where onions are growing but the wild onions are growing.

Where wild onions are growing in winter grazing crop, you can use amine 2,4-D to knock the onions down and out of the way of the grazing.

Another weed to look out for now is thistle. Many areas are solid with thistle. Thistles can also be controlled with amine 2,4-D.

If you intend to spray bitter

weeds, you should get your spray ready to use in March and April. Amines like cotton cannot be sprayed until after frost. At this time, higher strength dieldrin and higher production rates are also indicated. Dieldrin strength is likely to increase in 1957 and prices should remain about the same as in 1956.

Beef cattle prices have had little change in 1957. Prices should remain well below prices of several years ago.

Hog numbers are down. This should result in fewer hogs being slaughtered and should reflect corresponding price increases throughout 1957.

Dairy products—While numbers of milk cows continues to decline, the production per cow shows considerable increase. With a declining surplus stock and an increased per capita consumption, to take care of the increase in production, prices generally should remain about the same.

Egg prices are expected to be lower in 1957 than in 1956.

Broiler numbers are expected to be up from 1956. But with the smaller supply of red meat expected on 1957 markets, prices should be around the same as in 1956, or slightly higher.

Forest Products—Supplies of practically all forest products are more or less limited, demand strong consumption increasing and prices are expected to continue relatively high.

Farmers must continue to cut production costs. This will take better planning, shooting for higher yields and making use of improved marketing services.

Remember there are only two ways to balance any budget—make more, or spend less.

PINE TREE PLANTING

For a higher percentage of survival, plant your pine seedlings properly.

Set them at the proper depth—at same depth of $\frac{1}{2}$ inch deeper than they grew in the nursery. Handle them carefully—do not let the roots dry out or expose them to wind or sun. A good method of taking seedlings to the planting area is to put them in a bucket and put in enough moss or mud to cover roots.

SOIL TESTING

Avoid the rush. The time to send soil samples to the State Soils Testing Laboratory at Mississippi State College for analysis. By doing this now, you will get ahead of the rush caused by last minute samples. You will get your recommendations back in plenty of time for the 1957 crop.

For soil boxes, information sheets and instructions for taking samples, see your county agent. The service is free.

Generally the agricultural outlook for 1957 is for continued high production of most products, higher prices for what you buy

OUR MISSISSIPPI INCOME TAX LAW

WHO SHOULD FILE A RETURN

An annual report of net income is required by the Mississippi State Income Tax Law, from every corporation, trust, estate, partnership, or fiduciary, regardless of the amount of gross or net income realized during the taxable period. The law is more liberal in its application to individuals. It requires a return of net income from individuals if (1) the net income exceeds the exemption, or (2) if the gross income exceeds \$6,000.00. If either of these conditions are satisfied, a return should be filed in order to comply with the statute.

The second condition is satisfied first in that it is disposed of more easily. Gross income is total wages or commissions in the case of an employee. In the case of a merchant, or other vendor, gross income is gross sales less cost of sales and even though a net loss may be sustained during the taxable period, a return must be filed if the gross income exceeds \$6,000.00.

The first condition set forth above requires a more extended discussion. The specific exemptions are: married persons (\$10,000.00 and single individuals, \$4,000.00. These are annual exemptions. They are specific in that they are fixed at a certain sum. Married persons may divide the specific exemption in any manner they choose, if separate returns are filed. The condition as of the last date of the year determines the status insofar as these exemptions are concerned except that the death of a spouse during the year will not change the status for that year.

From and after January 1, 1952, the State Income Tax Law contains no reference to dependent, head of family, medical expense, and insurance premiums. There are only two exemptions: those allowed married persons, and those allowed single persons.

The returns are filed by partnerships and fiduciaries are information returns only. This also applies to returns filed by trusts and estates, if the entire income is distributed to the beneficiaries thereof. If, by the terms of the trust instruments or the will of the decedent, the trustee or executor is required to distribute the income to the beneficiaries, the return will be filed by such trust or estate on the partnership form; otherwise, the income will be reported and the tax paid by the trustee or executor. No exemption is provided for trusts or estates.

The Commissioner of Income Tax urges every individual, who may be supplied with a return form, to complete that form and mail it to the Tax Commission, Box 960, Jackson, Mississippi, so as to avoid the annoyance of correspondence, at a later date, concerning the liability to file a return or pay a tax. The more information on file in the Tax Commission, the fewer will be the letters written relative to probable delinquencies and income tax liabilities. Our district service offices and the office in Jackson are always ready to give advice and information, and assistance is available at any time, with respect to preparing and filing returns required by the Mississippi Income Tax Law.

Although the law specified that returns are due 2½ months after the close of the taxable period, the Mississippi Legislature, during its 1954 Regular Session, enacted a statute which authorized the Commissioner of Income Tax with the approval of the Governor, to extend the due date for a period of thirty days so as to conform to the amended provisions of the Federal Income Tax Law. Accordingly, all income tax returns are due 3½ months after the close of the taxable period, effective from and after December 31, 1954.

SENATOR EASTLAND ASKS REOPENING OF SCLEOROSIS CASES

Washington, D. C.—Senator James O. Eastland (D-Miss.) today went to the aid of a second Mississippi veteran suffering from a form of sclerosis, a serious ailment which he believes may have some relationship to military service on South Pacific Islands.

He asked the chief benefits director of the Veterans Administration here to re-open the case of Robert C. Robb, Jr., of Vicksburg, Miss., whose application for a service-connected disability compensation was denied on October 24, 1953.

The action followed Senator Eastland's request two weeks ago for a review of a regional ruling in the case of James T. Westmoreland Jr., of Corinth, Miss., where service-connected disability was denied.

Since news stories of the Westmoreland case, Eastland said, he received information from various parts of the United States on nine other cases of servicemen who contracted some form of sclerosis after serving on Guam or other islands in the Pacific. The disease was first detected in all the men when they were in their early or middle thirties.

"Every case I have been presented to my attention fits the same basic syndrome," Senator Eastland said.

Furthermore, a New Jersey voter who fell victim to multiple sclerosis under circumstances strikingly similar to Robb was

Soil Conservation...

by HUGH C. SANFORD - J. S. HOWLE

This is the last of three articles by Verne E. Davison, Biologist, Soil Conservation Service.

MANAGING THE FISH IN FARM PONDS

In the previous articles we discussed the first two important features of satisfactory fishponds: (1) good construction on a suitable site, and (2) the fertility of the water. The third problem is how to manage the fish themselves.

There are five essential things to do:

1. Be sure you have no fish in the pond before you stock with hatchery fingerlings. You can be sure only if you seine the pond with a minnow seine.

If you catch fingerlings, you cannot stock correctly until you kill those wild fish which are present. No use to stock 1,000 to 1,500 bluegills and 100 bass per acre into a pond with a population of untold numbers (usually several thousand numbers per acre).

The 1,000 or 1,500 bluegills and 100 bass per acre are the correct numbers to stock in ponds of high fertility. These numbers are too high for average natural water fertility—2 to 3 times too many, in fact. Stocking rates are always uncertain for the unfertilized ponds. No one knows how many fish such waters will grow to satisfactory size.

2. To attain a 4 ounce-size

and to prevent an overpopulation the second year, you must stock your bluegills before January. Early fall is best, but October, November and even December are not too late. The bass are correctly supplied the following April, May or June.

3. Don't fish either the bluegills or bass until the bass have been in your pond nearly a year.

Otherwise you will find your first hatch of bluegills beginning to overpopulate the pond the second year. Maintain good fertility—feed the fish well—from early

granted disability while Robb's claim was being rejected, Senator Eastland said.

Westmoreland's case was turned down because his arterio lateral sclerosis developed after the two year period following discharge during which service connection usually is established. But the veteran contends that the incidence of sclerosis is higher on Guam than anywhere else in the world, and that since the disease usually waits until the 30's to strike it might have lain dormant in him during that time. Eastland is continuing to press Westmoreland's claim.

But Robb's case of multiple sclerosis was established by competent lay testimony as early as July, 1953. He had been discharged in January, 1952, which would put his claim well within the two year limit. He served on the island of Saipan.

The New Jersey veteran was on Guam twice during his first tour of duty from 1942 to 1946. He did not serve overseas during his second tour from 1950 to 1951. Yet he was granted service connection under presumptive provisions of the law when he first sought treatment for multiple sclerosis in July, 1953.

Robb, an employee of the U. S. Army Engineers at Vicksburg, now goes to work on crutches and feels that he will have to leave work soon. He has a wife and small daughter. He says his main concern is not for himself but to protect the future of his wife and children.

Where medical science admits a complete and abysmal ignorance as to the origin and development of a disease, every possible doubt should be resolved in favor of the claimants, who are the helpless victims of what appears to be one of the most horrible of ailments not yet conquered by the ingenuity of medicine," Senator Eastland declared.

Other cases uncovered by Eastland's nationwide search include a former Guam Seabee who was granted service connection because sclerosis developed within two years, a Virginia veteran who fell ill to sclerosis within seven months after discharge following service on Guam in 1945 and 1946, a Coast Artillery Corps officer who served on Bora-Bora and who was retired because of multiple sclerosis at the age of 31, a World War II aviation hero who developed symptoms of the disease at the age of 34 after European service.

Incomplete information has been received on similar cases from Michigan, New York and Louisiana.

Senator Eastland is anxious to receive further information on other cases falling in the pattern.

The trouble with most people is that they talk too much about too little.

\$2,475 awards have been made for heroes by the Scout National Court of Honor since 1951.

Since 1951 a total of 21,055 merit badges were earned by Boy Scouts of America.

The total investment in Boy Scout camps throughout the nation exceeds \$60,000,000.

spring and fall every year.

4. Begin fishing as soon as you can find little bass around the edge. This should be in late September or early October.

5. Catch a few in your minnow seine. You can be sure it is a bass if its mouth will open as large as its body. When you find these fingerlings, you know your stocking turned out successfully. You are ready for gin fishing.

6. Fish your bass lightly for the first month or two. Many ponds have been hurt by heavy bass removal in the opening weeks. Heavy fishing is all right after July that opening year.

Fishing is poor in many farm ponds because the fish population is too numerous. We call it over-population. But "overpopulation" refers to neither pan-size nor two-to-inch fingerling fish. You cannot have too many of either.

You want more of catchable size, and the little fingerlings are your bass food. Overpopulation usually means too many bluegills, two to six inches long (less than two quounces each in weight). Shad, shiners, suckers, and intermediate size fish of any kind also size "overpopulation." You can avoid this condition; or you can correct the condition if it occurs.

Surprisingly, each of the following measures help avoid overpopulation; good site, deep edges, wide spillways, weed prevention, early stocking, early and adequate fertilization every year. No fishing at the bass spawn, light bass fishing at first, moderate to heavy fishing thereafter, and the correct numbers of bass and bluegills when you stock.

You will need help from someone with a lot of fishpond experience—to correct a poor population. USDA Farmers' Bulletin 2094 will suggest the corrections possible. Its information will help you avoid troublesome fish populations, and will help you manage the water and fish for good fishing. Since most modern farm ponds are 100-year projects, there is comfort in knowing that you can kill a troublesome fish population completely, restock correctly, and have excellent fishing 18 months later.

CARAMEL SAUCE

1/2 cup Brown sugar
1/4 cup Water or milk
1/4 cup Butter, melted
Boil sugar and water or milk in the top of a double boiler. Heat, stirring frequently, until the caramels are melted and the sauce is smooth. Serve this sauce, hot or cold, on ice cream.
Yield: 1 cup sauce.
